TRAINING TRANSCRIPT

redSling Builder: Page Settings

Introduction

Welcome to the redSling Training Portal. In this video, you'll learn how to configure page settings, create a new page, and manage pages within your application project.

By the end of this lesson, you'll be able to:

- Configure page settings
- Define SEO information
- Add custom meta tags
- Create a new page
- Access the Builder workspace
- Manage existing pages
- Perform page-level actions

1. Configure Page Information

The first section of the Page Settings screen captures the core information for your page. Begin by entering a meaningful page name that clearly represents the purpose of the screen.

Next, define the page slug. The slug becomes part of the application's URL structure and helps uniquely identify the page within the project.

2. Configure SEO Settings

The next section focuses on Search Engine Optimization, commonly referred to as SEO. Here you can define:

- SEO Title
- SEO Keywords
- SEO Description

These settings help search engines better understand the content and purpose of your page.

3. Configure Custom Meta Tags

redSling also allows you to define custom meta tags for advanced page configurations. Custom meta tags can be used for:

- Search engine directives
- Social media sharing metadata
- Third-party integrations
- Security-related configurations
- Analytics tracking requirements

To add a custom meta tag, enter the required metadata and save it as part of the page configuration.

> **Best practice: Only add custom meta tags that are required for your application to avoid unnecessary page overhead.**

4. Review Page Configuration

Before creating the page, review all configured information. Verify that:

- Page details are correct
- SEO information is complete
- Custom meta tags have been added where required

5. Create the Page

Once all settings have been reviewed, click the Create Page button.

6. Builder Initialization

After the page is created, redSling automatically initializes the Builder environment.

7. Page Management Dashboard

After page creation, the newly created page appears within the Page Management Dashboard. The dashboard serves as the central location for managing all pages within your project.

8. Page Actions

Each page includes an actions menu that provides quick access to page-level operations. Depending on your permissions and project configuration, available actions may include:

- Edit Page Settings
- Open in Builder
- Duplicate Page
- Manage Configurations
- Delete Page

These actions enable efficient page management throughout the application's lifecycle.

9. Delete Page Workflow

The final section demonstrates the page deletion process. When a delete action is initiated, redSling presents a confirmation dialog to prevent accidental removal of application assets.

Users should carefully review the confirmation message before proceeding. Upon confirmation, the page is permanently removed from the project.
